

PRESS RELEASE.

FROILABO ULTRA LOW FREEZERS.

Scientifix is pleased to announce the release of a new model in the already extensive range of ultra low freezers from Froilabo based in France.

The new Froilabo BMT model includes all of the class leading capabilities of the low cost BM range, which include the latest VIP insulation, environmentally friendly refrigerants, ease of maintenance and high reliability, and adds a convenient digital display and interface including data logging for more convenience.

The BM series now includes underbench units and upright and chest models from 175 litres through to 1000 litres capacity. The simplest and most economical BM series units are ideal for the majority of laboratories and come with long warranty as standard and up to 25% more cryovial storage for the same lab footprint.

Unlike many competitive units which use their own proprietary compressors, electronics or refrigerant gases, the Froilabo freezers use industry standard components. This means that compressors, control electronics and refrigerant gases are readily available across Australia and repairs are able to be handled quickly and inexpensively.

A complete array of accessories such as CO2 or LN backup, autodiallers and other interfacing devices are available. As well a complete range of racks, trays and buckets are available to optimize storage of valuable samples within the freezer.

For extended maintenance of low temperatures in the event of a power failure we recommend the unique Cryo-accumulator accessory for our freezers.

All Froilabo products are backed by trained service support across Australia.
